# Package 'CohortMethod'

August 27, 2016

```
Type Package

Title New-user cohort method with large scale propensity and outcome models

Version 2.0.5

Date 2015-08-08

Author Martijn J. Schuemie [aut, cre],
Marc A. Suchard [aut],
Patrick B. Ryan [aut]

Maintainer Martijn J. Schuemie <schuemie@ohdsi.org>
```

Description CohortMethod is an R package for performing new-user cohort studies in an observational database in the OMOP Common Data Model. It extracts the necessary data from a database in OMOP Common Data Model format, and uses a large set of covariates for both the propensity and outcome model, including for example all drugs, diagnoses, procedures, as well as age, comorbidity indexes, etc. Large scale regularized regression is used to fit the propensity and outcome models. Functions are included for trimming, stratifying and matching on propensity scores, as well as diagnostic functions, such as propensity score distribution plots and plots showing covariate balance before and after matching and/or trimming. Supported outcome models are (conditional) logistic regression, (conditional) Poisson regression, and (stratified) Cox regression.

checkCmInstallation

Check is CohortMethod and its dependencies are correctly installed

### **Description**

Check is CohortMethod and its dependencies are correctly installed

### Usage

checkCmInstallation(connectionDetails)

### **Arguments**

connectionDetails

An R object of type

 ${\tt connectionDetails\ created\ using\ the\ function\ createConnectionDetails\ in\ the\ DatabaseConnector\ package.}$ 

### **Details**

This function checks whether CohortMethod and its dependencies are correctly installed. This will check the database connectivity, large scale regresion engine (Cyclops), and large data object handling (ff).

CohortMethod

CohortMethod

### Description

CohortMethod

 ${\it cohort} {\it MethodDataSimulationProfile} \\ A {\it simulation profile}$ 

### **Description**

A simulation profile

### Usage

data(cohortMethodDataSimulationProfile)

computeCovariateBalance

Compute covariate balance before and after matching and trimming

### **Description**

For every covariate, prevalence in treatment and comparator groups before and after matching/trimming are computed. When variable ratio matching was used the balance score will be corrected according the method described in Austin et al (2008).

### Usage

computeCovariateBalance(population, cohortMethodData)

### **Arguments**

population A data frame containing the people that are remaining after matching and/or trimming.

cohortMethodData

An object of type cohortMethodData as generated using getDbCohortMethodData.

### **Details**

The population data frame should have at least the following columns:

rowId (integer) A unique identifier for each row (e.g. the person ID)
treatment (integer) Column indicating whether the person is in the treated (1) or comparator (0)
group

### Value

Returns a date frame describing the covariate balance before and after matching/trimming.

### References

Austin, P.C. (2008) Assessing balance in measured baseline covariates when using many-to-one matching on the propensity-score. Pharmacoepidemiology and Drug Safety, 17: 1218-1225.

constructEras 5

computePsA	HIC

Compute the area under the ROC curve

### **Description**

computePsAuc computes the area under the ROC curve of the propensity score

### Usage

```
computePsAuc(data, confidenceIntervals = FALSE)
```

### **Arguments**

```
data  A \ data \ frame \ with \ at \ least \ the \ two \ columns \ described \ below \ confidence Intervals
```

Compute 95 percent confidence intervals (computationally expensive for large data sets)

### **Details**

The data frame should have a least the following two columns:

```
treatment (integer) Column indicating whether the person is in the treated (1) or comparator
```

(0) group

propensityScore (numeric) Propensity score

### Value

A data frame holding the AUC and its 95 percent confidence interval

### **Examples**

```
treatment <- rep(0:1, each = 100)
propensityScore <- c(rnorm(100, mean = 0.4, sd = 0.25), rnorm(100, mean = 0.6, sd = 0.25))
data <- data.frame(treatment = treatment, propensityScore = propensityScore)
data <- data[data$propensityScore > 0 & data$propensityScore < 1, ]
computePsAuc(data)</pre>
```

construct Eras

Build eras

### Description

Constructs eras (continuous periods of exposure or disease).

6 constructEras

#### Usage

```
constructEras(connectionDetails, sourceDatabaseSchema,
  sourceTable = "drug_exposure",
  targetDatabaseSchema = sourceDatabaseSchema, targetTable = "drug_era",
  createTargetTable = FALSE, cdmDatabaseSchema = sourceDatabaseSchema,
  gracePeriod = 30, rollUp = TRUE, rollUpConceptClassId = "Ingredient",
  rollUpVocabularyId = "RxNorm", cdmVersion = "5")
```

### **Arguments**

connectionDetails

An R object of type connectionDetails created using the function createConnectionDetails in the DatabaseConnector package.

sourceDatabaseSchema

The name of the database schema that contains the source table. Requires read permissions to this database. On SQL Server, this should specify both the database and the schema, so for example 'cdm\_instance.dbo'.

sourceTable The name of the source table.

targetDatabaseSchema

The name of the database schema that contains the target table. Requires write permissions to this database. On SQL Server, this should specify both the database and the schema, so for example 'cdm\_instance.dbo'.

targetTable The name of the target table.

createTargetTable

Should the target table be created? If not, the data is inserted in an existing table.

cdmDatabaseSchema

Only needed when rolling up concepts to ancestors: The name of the database schema that contains the vocabulary files. Requires read permissions to this database. On SQL Server, this should specify both the database and the schema, so for example 'cdm\_instance.dbo'.

gracePeriod

The number of days allowed between periods for them to still be considered part of the same era.

rollUp Si

Should concepts be rolled up to their ancestors?

rollUpConceptClassId

The identifier of the concept class to which concepts should be rolled up.

rollUpVocabularyId

The identifier of the vocabulary to which concepts should be rolled up.

cdmVersion The verion of the CDM that is being used.

### Details

This function creates eras from source data. For example, one could use this function to create drug eras based on drug exposures. The function allows drugs to be rolled up to ingredients, and prescriptions to the same ingredient that overlap in time are merged into a single ingredient. Note that stockpiling is not assumed to take place (ie. overlap is discarded), but a grace period can be specified allowing for a small gap between prescriptions when merging. The user can specify the source and target table. These tables are assumed to have the same structure as the cohort table in the Common Data Model (CDM), except when the table names are 'drug\_exposure' or 'condition\_occurrence' for the source table, or 'drug\_era' or 'condition\_era' for the target table, in which case the tables are assumed to have the structure defined for those tables in the CDM.

createCmAnalysis 7

If both the source and target table specify a field for type\_concept\_id, the era construction will partition by the type\_concept\_id, in other words periods with different type\_concept\_ids will be treated independently.

### **Examples**

```
## Not run:
# Constructing drug eras in CDM v4:
constructEras(connectionDetails,
              sourceDatabaseSchema = cdmDatabaseSchema,
              sourceTable = "drug_exposure",
              targetTable = "drug_era",
              createTargetTable = FALSE,
              gracePeriod = 30,
              rollUpVocabularyId = 8,
              rollUpConceptClassId = "Ingredient",
              cdmVersion = "4")
# Constructing drug eras in CDM v5:
constructEras(connectionDetails,
              sourceDatabaseSchema = cdmDatabaseSchema,
              sourceTable = "drug_exposure",
              targetTable = "drug_era",
              createTargetTable = FALSE,
              gracePeriod = 30,
              rollUpVocabularyId = "RxNorm",
              rollUpConceptClassId = "Ingredient",
              cdmVersion = "5")
## End(Not run)
```

createCmAnalysis

Create a CohortMethod analysis specification

### **Description**

Create a CohortMethod analysis specification

### Usage

```
createCmAnalysis(analysisId = 1, description = "", targetType = NULL,
  comparatorType = NULL, getDbCohortMethodDataArgs, createStudyPopArgs,
  createPs = FALSE, createPsArgs = NULL, trimByPs = FALSE,
  trimByPsArgs = NULL, trimByPsToEquipoise = FALSE,
  trimByPsToEquipoiseArgs = NULL, matchOnPs = FALSE, matchOnPsArgs = NULL,
  matchOnPsAndCovariates = FALSE, matchOnPsAndCovariatesArgs = NULL,
  stratifyByPs = FALSE, stratifyByPsArgs = NULL,
  stratifyByPsAndCovariates = FALSE, stratifyByPsAndCovariatesArgs = NULL,
  computeCovariateBalance = FALSE, fitOutcomeModel = FALSE,
  fitOutcomeModelArgs = NULL)
```

8 createCmAnalysis

### **Arguments**

analysisId An integer that will be used later to refer to this specific set of analysis choices.

description A short description of the analysis.

targetType If more than one target is provided for each drugComparatorOutcome, this field

should be used to select the specific target to use in this analysis.

comparatorType If more than one comparator is provided for each drugComparatorOutcome, this

field should be used to select the specific comparator to use in this analysis.

getDbCohortMethodDataArgs

An object representing the arguments to be used when calling the getDbCohortMethodData

function.

createStudyPopArgs

An object representing the arguments to be used when calling the createStudyPopulation

function.

createPs Should the createPs function be used in this analysis?

createPsArgs An object representing the arguments to be used when calling the createPs

function.

trimByPs Should the trimByPs function be used in this analysis?

trimByPsArgs An object representing the arguments to be used when calling the trimByPs

function.

trimByPsToEquipoise

Should the trimByPsToEquipoise function be used in this analysis?

trimByPsToEquipoiseArgs

An object representing the arguments to be used when calling the trimByPsToEquipoise

function.

matchOnPs Should the matchOnPs function be used in this analysis?

matchOnPsArgs An object representing the arguments to be used when calling the matchOnPs

function.

matchOnPsAndCovariates

Should the matchOnPsAndCovariates function be used in this analysis?

matchOnPsAndCovariatesArgs

An object representing the arguments to be used when calling the matchOnPsAndCovariates

function.

stratifyByPs Should the stratifyByPs function be used in this analysis?

stratifyByPsArgs

An object representing the arguments to be used when calling the  ${\tt stratifyByPs}$ 

function.

stratifyByPsAndCovariates

Should the stratifyByPsAndCovariates function be used in this analysis?

stratifyByPsAndCovariatesArgs

 $An object \ representing \ the \ arguments \ to \ be \ used \ when \ calling \ the \ {\tt stratifyByPsAndCovariates}$ 

function.

 ${\tt computeCovariateBalance}$ 

Should the computeCovariateBalance function be used in this analysis?

fitOutcomeModel

Should the fitOutcomeModel function be used in this analysis?

fitOutcomeModelArgs

An object representing the arguments to be used when calling the fitOutcomeModel

function.

#### **Details**

Create a set of analysis choices, to be used with the runCmAnalyses function.

 $\label{lem:create} C create {\tt CohortMethodDataSimulationProfile} \\ {\tt Create\ simulation\ profile}$ 

### Description

createCohortMethodDataSimulationProfile creates a profile based on the provided cohort-MethodData object, which can be used to generate simulated data that has similar characteristics.

### Usage

createCohortMethodDataSimulationProfile(cohortMethodData)

### **Arguments**

cohortMethodData

An object of type cohortMethodData as generated using getDbCohortMethodData.

#### **Details**

The output of this function is an object that can be used by the simulateCohortMethodData function to generate a cohortMethodData object.

### Value

An object of type cohortDataSimulationProfile.

createCreatePsArgs

Create a parameter object for the function createPs

### Description

Create a parameter object for the function createPs

### Usage

```
createCreatePsArgs(excludeCovariateIds = c(), includeCovariateIds = c(),
  errorOnHighCorrelation = TRUE, stopOnError = TRUE,
  prior = createPrior("laplace", exclude = c(0), useCrossValidation = TRUE),
  control = createControl(noiseLevel = "silent", cvType = "auto", tolerance =
  2e-07, cvRepetitions = 10, startingVariance = 0.01))
```

### **Arguments**

excludeCovariateIds

Exclude these covariates from the propensity model.

includeCovariateIds

Include only these covariates in the propensity model.

errorOnHighCorrelation

If true, the function will test each covariate for correlation with thetreatment assignment. If any covariate has an unusually high correlation(either positive or

negative), this will throw and error.

stopOnError If an error occurrs, should the function stop? Else, the two cohortswill be as-

sumed to be perfectly separable.

prior The prior used to fit the model. See createPriorfor details.

control The control object used to control the cross-validation used todetermine the hy-

perparameters of the prior (if applicable). SeecreateControl for details.

#### **Details**

Create an object defining the parameter values.

createCreateStudyPopulationArgs

Create a parameter object for the function createStudyPopulation

### Description

Create a parameter object for the function createStudyPopulation

### Usage

```
createCreateStudyPopulationArgs(firstExposureOnly = FALSE,
  washoutPeriod = 0, removeDuplicateSubjects = FALSE,
  removeSubjectsWithPriorOutcome = TRUE, priorOutcomeLookback = 99999,
  minDaysAtRisk = 1, riskWindowStart = 0, addExposureDaysToStart = FALSE,
  riskWindowEnd = 0, addExposureDaysToEnd = TRUE)
```

### **Arguments**

firstExposureOnly

Should only the first exposure per subject be included? Note that this is typically done in the createStudyPopulation function,

washoutPeriod The minimum required continuous observation time prior to indexdate for a person to be included in the cohort.

removeDuplicateSubjects

Remove subjects that are in both the treated and comparator cohort? removeSubjectsWithPriorOutcome

Remove subjects that have the outcome prior to the risk window start?

priorOutcomeLookback

How many days should we look back when identifying prior outcomes?

minDaysAtRisk The minimum required number of days at risk.

riskWindowStart

The start of the risk window (in days) relative to the index date (+days of exposure if the addExposureDaysToStart parameter isspecified).

addExposureDaysToStart

Add the length of exposure the start of the risk window?

riskWindowEnd

The end of the risk window (in days) relative to the index data (+days of exposure if the addExposureDaysToEnd parameter isspecified).

addExposureDaysToEnd

Add the length of exposure the risk window?

#### **Details**

Create an object defining the parameter values.

createDrugComparatorOutcomes

Create drug-comparator-outcomes combinations.

### **Description**

Create drug-comparator-outcomes combinations.

#### Usage

```
createDrugComparatorOutcomes(targetId, comparatorId, outcomeIds,
  excludedCovariateConceptIds = c(), includedCovariateConceptIds = c())
```

### **Arguments**

targetId

A concept ID indentifying the target drug in the exposure table. If multiple strategies for picking the target will be tested in the analysis, a named list of numbers can be provided instead. In the analysis, the name of the number to be used can be specified using the #' targetType parameter in the createCmAnalysis function.

comparatorId

A concept ID indentifying the comparator drug in the exposure table. If multiple strategies for picking the comparator will be tested in the analysis, a named list of numbers can be provided instead. In the analysis, the name of the number to be used can be specified using the #' comparatorType parameter in the createCmAnalysis function.

 $\label{eq:concept} \begin{tabular}{ll} \textbf{OutcomeIds} & A \ vector \ of \ concept \ IDs \ indentifying \ the \ outcome(s) \ in \ the \ outcome \ table. \\ \textbf{excludedCovariateConceptIds} \end{tabular}$ 

A list of concept IDs that cannot be used to construct covariates. This argument is to be used only for exclusion concepts that are specific to the drug-comparator combination.

 $included {\tt CovariateConceptIds}$ 

A list of concept IDs that must be used to construct covariates. This argument is to be used only for inclusion concepts that are specific to the drug-comparator combination.

### Details

Create a set of hypotheses of interest, to be used with the runCmAnalyses function.

createFitOutcomeModelArgs

Create a parameter object for the function fitOutcomeModel

### **Description**

Create a parameter object for the function fitOutcomeModel

### Usage

```
createFitOutcomeModelArgs(modelType = "logistic", stratified = TRUE,
  useCovariates = TRUE, excludeCovariateIds = c(),
  includeCovariateIds = c(), prior = createPrior("laplace",
  useCrossValidation = TRUE), control = createControl(cvType = "auto",
  startingVariance = 0.01, tolerance = 2e-07, cvRepetitions = 10, selectorType =
  "byPid", noiseLevel = "quiet"))
```

### **Arguments**

modelType The type of outcome model that will be used. Possible values are "logistic",

"poisson", or "cox".

stratified Should the regression be conditioned on the strata defined in the populationob-

ject (e.g. by matching or stratifying on propensity scores)?

useCovariates Whether to use the covariate matrix in the cohortMethodData object in theout-

come model.

excludeCovariateIds

Exclude these covariates from the outcome model.

includeCovariateIds

Include only these covariates in the outcome model.

prior The prior used to fit the model. SeecreatePrior for details.

control The control object used to control the cross-validation used todetermine the hy-

perparameters of the prior (if applicable). SeecreateControl for details.

### **Details**

Create an object defining the parameter values.

createGetDbCohortMethodDataArgs

Create a parameter object for the function getDbCohortMethodData

### **Description**

Create a parameter object for the function getDbCohortMethodData

### Usage

```
createGetDbCohortMethodDataArgs(studyStartDate = "", studyEndDate = "",
   excludeDrugsFromCovariates = TRUE, firstExposureOnly = FALSE,
   removeDuplicateSubjects = FALSE, washoutPeriod = 0, covariateSettings)
```

#### **Arguments**

 ${\tt studyStartDate} \quad A \ calendar \ date \ specifying \ the \ minimum \ date \ that \ a \ cohort \ index date \ can \ appear.$ 

Date format is 'yyyymmdd'.

studyEndDate A calendar date specifying the maximum date that a cohort indexdate can ap-

pear. Date format is 'yyyymmdd'. Important: the studyend data is also used to truncate risk windows, meaning no outcomesbeyond the study end date will be

considered.

excludeDrugsFromCovariates

Should the target and comparator drugs (and their descendantconcepts) be excluded from the covariates? Note that this willwork if the drugs are actualy drug

concept IDs (and not cohortIDs).

firstExposureOnly

Should only the first exposure per subject be included? Note thatthis is typically done in the createStudyPopulation function,but can already be done here for

efficiency reasons.

removeDuplicateSubjects

Remove subjects that are in both the treated and comparator cohort? Note thatthis is typically done in the createStudyPopulation function,but can already

be done here for efficiency reasons.

washoutPeriod The minimum required continuous observation time prior to indexdate for a per-

son to be included in the cohort. Note thatthis is typically done in the createS-tudyPopulation function,but can already be done here for efficiency reasons.

covariateSettings

An object of type covariateSettings as created using thecreateCovariateSettings

function in the Feature Extraction package.

### **Details**

Create an object defining the parameter values.

createMatchOnPsAndCovariatesArgs

Create a parameter object for the function matchOnPsAndCovariates

#### **Description**

Create a parameter object for the function matchOnPsAndCovariates

### Usage

```
createMatchOnPsAndCovariatesArgs(caliper = 0.25,
  caliperScale = "standardized", maxRatio = 1, covariateIds)
```

### **Arguments**

caliper

The caliper for matching. A caliper is the distance which is acceptable for any match. Observations which are outside of the caliper are dropped. A caliper of 0 means no caliper is used.

caliperScale The scale on which the caliper is defined. Two scales are supported: caliperScale

= 'propensity score' or caliperScale = 'standardized'. On the standardized scale, the caliper is interpreted in standard deviations of the propensity scoredistribu-

tion.

maxRatio The maximum number of persons int the comparator arm to be matched to each-

person in the treatment arm. A maxRatio of 0 means no maximum: allcompara-

tors will be assigned to a treated person.

covariateIds One or more covariate IDs in the cohortMethodData object on whichsubjects

should be also matched.

### **Details**

Create an object defining the parameter values.

createMatchOnPsArgs

Create a parameter object for the function matchOnPs

#### **Description**

Create a parameter object for the function matchOnPs

### Usage

```
createMatchOnPsArgs(caliper = 0.25, caliperScale = "standardized",
    maxRatio = 1, stratificationColumns = c())
```

### **Arguments**

caliper The caliper for matching. A caliper is the distance which isacceptable for any

match. Observations which are outside of the caliper are dropped. A caliper of 0

means no caliper is used.

caliperScale The scale on which the caliper is defined. Two scales are supported:caliperScale

= 'propensity score' or caliperScale = 'standardized'. On the standardized scale, the caliper isinterpreted in standard deviations of the propensity scoredistribu-

tion.

maxRatio The maximum number of persons int the comparator arm to be matched to each

person in the treatment arm. A maxRatio of 0 means no maximum:all compara-

tors will be assigned to a treated person.

stratificationColumns

Names or numbers of one or more columns in the data data.frameon which subjects should be stratified prior to matching. No personswill be matched with persons outside of the strata identified by thevalues in these columns.

### Details

Create an object defining the parameter values.

createPs 15

createPs	Create propensity scores	

### **Description**

createPs creates propensity scores using a regularized logistic regression.

### Usage

```
createPs(cohortMethodData, population, excludeCovariateIds = c(),
  includeCovariateIds = c(), errorOnHighCorrelation = TRUE,
  stopOnError = TRUE, prior = createPrior("laplace", exclude = c(0),
  useCrossValidation = TRUE), control = createControl(noiseLevel = "silent",
  cvType = "auto", tolerance = 2e-07, cvRepetitions = 10, startingVariance =
  0.01))
```

#### **Arguments**

cohortMethodData

An object of type cohortMethodData as generated using getDbCohortMethodData.

population

A data frame describing the population. This should at least have a 'rowId' column corresponding to the rowId column in the cohortMethodData covariates object and a 'treatment' column. If population is not specified, the full population in the cohortMethodData will be used.

excludeCovariateIds

Exclude these covariates from the propensity model.

includeCovariateIds

Include only these covariates in the propensity model.

errorOnHighCorrelation

If true, the function will test each covariate for correlation with the treatment assignment. If any covariate has an unusually high correlation (either positive

or negative), this will throw and error.

stopOnError If an error occurrs, should the function stop? Else, the two cohorts will be

assumed to be perfectly separable.

prior The prior used to fit the model. See createPrior for details.

control The control object used to control the cross-validation used to determine the

hyperparameters of the prior (if applicable). See createControl for details.

### **Details**

createPs creates propensity scores using a regularized logistic regression.

### **Examples**

```
data(cohortMethodDataSimulationProfile)
cohortMethodData <- simulateCohortMethodData(cohortMethodDataSimulationProfile, n = 1000)
ps <- createPs(cohortMethodData)</pre>
```

 ${\tt createStratifyByPsAndCovariatesArgs}$ 

Create a parameter object for the function stratifyByPsAndCovariates

### **Description**

Create a parameter object for the function stratifyByPsAndCovariates

### Usage

createStratifyByPsAndCovariatesArgs(numberOfStrata = 5, covariateIds)

### **Arguments**

numberOfStrata Into how many strata should the propensity score be divided? Theboundaries of the strata are automatically defined to contain equalnumbers of treated persons.

 ${\tt covariateIds} \qquad {\tt One \ or \ more \ covariate \ IDs \ in \ the \ cohortMethodData \ object \ on \ which subjects}$ 

should also be stratified.

### **Details**

Create an object defining the parameter values.

createStratifyByPsArgs

Create a parameter object for the function stratifyByPs

### **Description**

Create a parameter object for the function stratifyByPs

### Usage

```
createStratifyByPsArgs(numberOfStrata = 5, stratificationColumns = c())
```

### **Arguments**

numberOfStrata How many strata? The boundaries of the strata are automatically defined to contain equal numbers of treated persons.

stratificationColumns

Names of one or more columns in the data data.frame on which subjects should also be stratified in addition to stratification on propensity score.

### **Details**

Create an object defining the parameter values.

createStudyPopulation 17

createStudyPopulation Create a study population

### **Description**

Create a study population

### Usage

```
createStudyPopulation(cohortMethodData, population = NULL, outcomeId,
  firstExposureOnly = FALSE, washoutPeriod = 0,
  removeDuplicateSubjects = FALSE, removeSubjectsWithPriorOutcome = TRUE,
  priorOutcomeLookback = 99999, minDaysAtRisk = 1, riskWindowStart = 0,
  addExposureDaysToStart = FALSE, riskWindowEnd = 0,
  addExposureDaysToEnd = TRUE)
```

### Arguments

cohortMethodData

An object of type cohortMethodData as generated using getDbCohortMethodData.

population If specified, this population will be used as the starting point instead of the co-

horts in the cohortMethodData object.

outcomeId The ID of the outcome. If not specified, no outcome-specific transformations

will be performed.

firstExposureOnly

Should only the first exposure per subject be included? Note that this is typically

 $done\ in\ the\ create Study Population\ function,$ 

washoutPeriod The mininum required continuous observation time prior to index date for a

person to be included in the cohort.

 ${\tt removeDuplicateSubjects}$ 

Remove subjects that are in both the treated and comparator cohort?

 ${\tt removeSubjectsWithPriorOutcome}$ 

Remove subjects that have the outcome prior to the risk window start?

priorOutcomeLookback

How many days should we look back when identifying prior outcomes?

minDaysAtRisk The minimum required number of days at risk.

riskWindowStart

The start of the risk window (in days) relative to the index date (+ days of exposure if the addExposureDaysToStart parameter is specified).

 $add {\tt Exposure Days To Start}$ 

Add the length of exposure the start of the risk window?

riskWindowEnd The end of the risk window (in days) relative to the index data (+ days of expo-

sure if the addExposureDaysToEnd parameter is specified).

 $add {\tt Exposure Days To End}$ 

Add the length of exposure the risk window?

### **Details**

Create a study population by enforcing certain inclusion and exclusion criteria, defining a risk window, and determining which outcomes fall inside the risk window.

#### Value

A data frame specifying the study population. This data frame will have the following columns:

rowId A unique identifier for an exposure

subjectId The person ID of the subject

cohortStartdate The index date

outcomeCount The number of outcomes observed during the risk window

timeAtRisk The number of days in the risk window

survivalTime The number of days until either the outcome or the end of the risk window

 ${\tt createTrimByPsArgs}$ 

Create a parameter object for the function trimByPs

### **Description**

Create a parameter object for the function trimByPs

### Usage

```
createTrimByPsArgs(trimFraction = 0.05)
```

### **Arguments**

trimFraction

This fraction will be removed from each treatment group. In the treatmentgroup, persons with the highest propensity scores will be removed, in the comparator group person with the lowest scores will be removed.

### **Details**

Create an object defining the parameter values.

```
{\tt createTrimByPsToEquipoiseArgs}
```

Create a parameter object for the function trimByPsToEquipoise

### **Description**

Create a parameter object for the function trimByPsToEquipoise

### Usage

```
createTrimByPsToEquipoiseArgs(bounds = c(0.25, 0.75))
```

### **Arguments**

bounds

The upper and lower bound on the preference score for keeping persons

#### **Details**

Create an object defining the parameter values.

drawAttritionDiagram 19

drawAttritionDiagram Draw the attrition diagram

### **Description**

drawAttritionDiagram draws the attition diagram, showing how many people were excluded from the study population, and for what reasons.

### Usage

```
drawAttritionDiagram(object, treatmentLabel = "Treated",
    comparatorLabel = "Comparator", fileName = NULL)
```

### **Arguments**

object Either an object of type cohortMethodData, a population object generated by

functions like createStudyPopulation, or an object of type outcomeModel.

treatmentLabel A label to us for the treated cohort.

comparatorLabel

A label to us for the comparator cohort.

fileName Name of the file where the plot should be saved, for example 'plot.png'. See the

function ggsave in the ggplot2 package for supported file formats.

### Value

A ggplot object. Use the ggsave function to save to file in a different format.

fitOutcomeModel

Create an outcome model, and compute the relative risk

### **Description**

 $\label{thm:comemodel} \mbox{fitOutcomeModel creates an outcome model, and computes the relative risk}$ 

### Usage

```
fitOutcomeModel(population, cohortMethodData, modelType = "logistic",
   stratified = TRUE, useCovariates = TRUE, excludeCovariateIds = c(),
   includeCovariateIds = c(), prior = createPrior("laplace",
   useCrossValidation = TRUE), control = createControl(cvType = "auto",
   startingVariance = 0.01, tolerance = 2e-07, cvRepetitions = 10, selectorType =
   "byPid", noiseLevel = "quiet"))
```

20 getAttritionTable

### **Arguments**

population A population object generated by createStudyPopulation, potentially filtered

by other functions.

cohortMethodData

An object of type cohortMethodData as generated using getDbCohortMethodData.

modelType The type of outcome model that will be used. Possible values are "logistic",

"poisson", or "cox".

stratified Should the regression be conditioned on the strata defined in the population

object (e.g. by matching or stratifying on propensity scores)?

useCovariates Whether to use the covariate matrix in the cohortMethodData object in the

outcome model.

excludeCovariateIds

Exclude these covariates from the outcome model.

includeCovariateIds

Include only these covariates in the outcome model.

prior The prior used to fit the model. See createPrior for details.

control The control object used to control the cross-validation used to determine the

hyperparameters of the prior (if applicable). See createControl for details.

#### Value

An object of class outcomeModel. Generic function summary, coef, and confint are available.

getAttritionTable Get the attrition table for a population

### **Description**

Get the attrition table for a population

### Usage

getAttritionTable(object)

### Arguments

object Either an object of type cohortMethodData, a population object generated by

functions like createStudyPopulation, or an object of type outcomeModel.

### Value

A data frame specifying the number of people and exposures in the population after specific steps of filtering.

getDbCohortMethodData Get the cohort data from the server

### **Description**

This function executes a large set of SQL statements against the database in OMOP CDM format to extract the data needed to perform the analysis.

### Usage

```
getDbCohortMethodData(connectionDetails, cdmDatabaseSchema,
  oracleTempSchema = cdmDatabaseSchema, targetId, comparatorId, outcomeIds,
  studyStartDate = "", studyEndDate = "",
  exposureDatabaseSchema = cdmDatabaseSchema, exposureTable = "drug_era",
  outcomeDatabaseSchema = cdmDatabaseSchema,
  outcomeTable = "condition_occurrence", cdmVersion = "5",
  excludeDrugsFromCovariates = TRUE, firstExposureOnly = FALSE,
  removeDuplicateSubjects = FALSE, washoutPeriod = 0, covariateSettings)
```

#### **Arguments**

connectionDetails

An R object of type connectionDetails created using the function createConnectionDetails in the DatabaseConnector package.

cdmDatabaseSchema

The name of the database schema that contains the OMOP CDM instance. Requires read permissions to this database. On SQL Server, this should specify both the database and the schema, so for example 'cdm\_instance.dbo'.

oracleTempSchema

For Oracle only: the name of the database schema where you want all temporary tables to be managed. Requires create/insert permissions to this database.

targetId A unique identifier to define the target cohort. If exposureTable = DRUG\_ERA,

targetId is a CONCEPT\_ID and all descendant concepts within that CONCEPT\_ID will be used to define the cohort. If exposureTable <> DRUG\_ERA, targetId is

used to select the cohort\_concept\_id in the cohort-like table.

comparatorId A unique identifier to define the comparator cohort. If exposureTable = DRUG\_ERA,

comparatorId is a CONCEPT\_ID and all descendant concepts within that CONCEPT\_ID will be used to define the cohort. If exposureTable <> DRUG\_ERA, comparatorId is used to select the cohort\_concept\_id in the cohort-like table.

outcomeIds A list of cohort\_definition\_ids used to define outcomes.

studyStartDate A calendar date specifying the minimum date that a cohort index date can ap-

pear. Date format is 'yyyymmdd'.

studyEndDate A calendar date specifying the maximum date that a cohort index date can ap-

pear. Date format is 'yyyymmdd'. Important: the study end data is also used to truncate risk windows, meaning no outcomes beyond the study end date will be

considered.

exposureDatabaseSchema

The name of the database schema that is the location where the exposure data used to define the exposure cohorts is available. If exposureTable = DRUG\_ERA, exposureDatabaseSchema is not used by assumed to be cdmSchema. Requires read permissions to this database.

exposureTable

The tablename that contains the exposure cohorts. If exposure Table <> DRUG\_ERA, then expectation is exposure Table has format of COHORT table: cohort\_concept\_id, SUBJECT\_ID, COHORT\_START\_DATE, COHORT\_END\_DATE.

outcomeDatabaseSchema

The name of the database schema that is the location where the data used to define the outcome cohorts is available. If exposureTable = CONDITION\_ERA, exposureDatabaseSchema is not used by assumed to be cdmSchema. Requires read permissions to this database.

outcomeTable

The tablename that contains the outcome cohorts. If outcomeTable <> CONDITION\_OCCURRENCE, then expectation is outcomeTable has format of COHORT table: COHORT\_DEFINITION\_ID, SUBJECT\_ID, COHORT\_START\_DATE, COHORT\_END\_DATE.

cdmVersion

Define the OMOP CDM version used: currently support "4" and "5".

excludeDrugsFromCovariates

Should the target and comparator drugs (and their descendant concepts) be excluded from the covariates? Note that this will work if the drugs are actualy drug concept IDs (and not cohort IDs).

firstExposureOnly

Should only the first exposure per subject be included? Note that this is typically done in the createStudyPopulation function, but can already be done here for efficiency reasons.

removeDuplicateSubjects

Remove subjects that are in both the treated and comparator cohort? Note that this is typically done in the createStudyPopulation function, but can already be done here for efficiency reasons.

washoutPeriod

The mininum required continuous observation time prior to index date for a person to be included in the cohort. Note that this is typically done in the createStudyPopulation function, but can already be done here for efficiency reasons.

covariateSettings

An object of type covariateSettings as created using the createCovariateSettings function in the FeatureExtraction package.

### **Details**

Based on the arguments, the treatment and comparator cohorts are retrieved, as well as outcomes occurring in exposed subjects. The treatment and comparator cohorts can be identified using the drug\_era table, or through user-defined cohorts in a cohort table either inside the CDM instance or in a separate schema. Similarly, outcomes are identified using the condition\_era table or through user-defined cohorts in a cohort table either inside the CDM instance or in a separate schema. Covariates are automatically extracted from the appropriate tables within the CDM. Important: The target and comparator drug must not be included in the covariates, including any descendant concepts. If the targetId and comparatorId arguments represent real concept IDs, you can set the excludeDrugsFromCovariates argument to TRUE and automatically the drugs and their descendants will be excluded from the covariates. However, if the targetId and comparatorId arguments do not represent concept IDs, you will need to manually add the drugs and descendants to the excludedCovariateConceptIds of the covariateSettings argument.

getOutcomeModel 23

#### Value

Returns an object of type cohortMethodData, containing information on the cohorts, their outcomes, and baseline covariates. Information about multiple outcomes can be captured at once for efficiency reasons. This object is a list with the following components:

**outcomes** A data frame listing the outcomes per person, including the time to event, and the outcome id. Outcomes are not yet filtered based on risk window, since this is done at a later stage.

**cohorts** A data frame listing the persons in each cohort, listing their exposure status as well as the time to the end of the observation period and time to the end of the cohort (usually the end of the exposure era).

**covariates** An ffdf object listing the baseline covariates per person in the two cohorts. This is done using a sparse representation: covariates with a value of 0 are omitted to save space.

covariateRef An ffdf object describing the covariates that have been extracted.

metaData A list of objects with information on how the cohortMethodData object was constructed.

The generic print() and summary() functions have been implemented for this object.

getOutcomeModel

Get the outcome model

### **Description**

getOutcomeModel shows the full outcome model, so showing the betas of all variables included in the outcome model, not just the treatment variable.

#### Usage

getOutcomeModel(outcomeModel, cohortMethodData)

### Arguments

outcomeModel An object of type outcomeModel as generated using he createOutcomeMode function.

cohortMethodData

An object of type cohortMethodData as generated using getDbCohortMethodData.

### Details

Shows the coefficients and names of the covariates with non-zero coefficients.

### **Examples**

# todo

24 grepCovariateNames

getPsModel

Get the propensity model

### **Description**

getPsModel shows the propensity score model

### Usage

```
getPsModel(propensityScore, cohortMethodData)
```

### **Arguments**

propensityScore

The propensity scores as generated using the createPs function.

cohortMethodData

An object of type cohortMethodData as generated using getDbCohortMethodData.

### **Details**

Shows the coefficients and names of the covariates with non-zero coefficients.

### **Examples**

# todo

grepCovariateNames

Extract covariate names

### **Description**

Extracts covariate names using a regular-expression.

### Usage

```
grepCovariateNames(pattern, object)
```

### Arguments

pattern A regular expression with which to name covariate names object An R object of type cohortMethodData or covariateData.

### **Details**

This function extracts covariate names that match a regular-expression for a cohortMethodData or covariateData object.

insertDbPopulation 25

#### Value

Returns a data.frame containing information about covariates that match a regular expression. This data.frame has the following columns:

covariateId Numerical identifier for use in model fitting using these covariates

covariateName Text identifier analysisId Analysis identifier

conceptId OMOP common data model concept identifier, or 0

insertDbPopulation

Insert a population into a database

### **Description**

Insert a population into a database

### Usage

```
insertDbPopulation(population, cohortIds = c(1, 0), connectionDetails, cohortDatabaseSchema, cohortTable = "cohort", createTable = FALSE, dropTableIfExists = TRUE, cdmVersion = "5")
```

### **Arguments**

population Either an object of type cohortMethodData or a population object generated by

functions like createStudyPopulation.

cohortIds The IDs to be used for the treated and comparator cohort, respectively.

connectionDetails

An R object of type

 ${\tt connectionDetails}\ created\ using\ the\ function\ {\tt createConnectionDetails}\ in$ 

the DatabaseConnector package.

cohortDatabaseSchema

The name of the database schema where the data will be written. Requires write permissions to this database. On SQL Server, this should specify both the

database and the schema, so for example 'cdm\_instance.dbo'.

cohortTable The name of the table in the database schema where the data will be written.

createTable Should a new table be created? If not, the data will be inserted into an existing

table.

dropTableIfExists

If createTable = TRUE and the table already exists it will be overwritten.

cdmVersion Define the OMOP CDM version used: currently support "4" and "5".

#### **Details**

Inserts a population table into a database. The table in the database will have the same structure as the 'cohort' table in the Common Data Model.

26 loadCohortMethodData

loadCmAnalysisList

Load a list of cmAnalysis from file

### Description

Load a list of objects of type cmAnalysis from file. The file is in JSON format.

### Usage

```
loadCmAnalysisList(file)
```

### **Arguments**

file

The name of the file

### Value

A list of objects of type cmAnalysis.

loadCohortMethodData

Load the cohort data from a folder

### Description

loadCohortMethodData loads an object of type cohortMethodData from a folder in the file system.

### Usage

```
loadCohortMethodData(file, readOnly = TRUE)
```

### **Arguments**

file

The name of the folder containing the data.

readOnly

If true, the data is opened read only.

### **Details**

The data will be written to a set of files in the folder specified by the user.

### Value

An object of class cohortMethodData.

### **Examples**

# todo

 ${\tt loadDrugComparatorOutcomesList}$ 

Load a list of drugComparatorOutcomes from file

### **Description**

Load a list of objects of type drugComparatorOutcomes from file. The file is in JSON format.

### Usage

loadDrugComparatorOutcomesList(file)

### **Arguments**

file The name of the file

#### Value

A list of objects of type drugComparatorOutcome.

matchOnPs

Match persons by propensity score

### **Description**

matchOnPs uses the provided propensity scores to match treated to comparator persons.

### Usage

```
matchOnPs(population, caliper = 0.25, caliperScale = "standardized",
    maxRatio = 1, stratificationColumns = c())
```

### **Arguments**

population A data frame with the three columns described below.

caliper The caliper for matching. A caliper is the distance which is acceptable for any

match. Observations which are outside of the caliper are dropped. A caliper of

0 means no caliper is used.

caliperScale The scale on which the caliper is defined. Two scales are supported:

caliperScale = 'propensity score' or caliperScale = 'standardized'. On the standardized scale, the caliper is interpreted in standard deviations of the

propensity score distribution.

maxRatio The maximum number of persons int the comparator arm to be matched to each

person in the treatment arm. A maxRatio of 0 means no maximum: all com-

parators will be assigned to a treated person.

stratification Columns

Names or numbers of one or more columns in the data data.frame on which subjects should be stratified prior to matching. No persons will be matched with persons outside of the strata identified by the values in these columns.

#### **Details**

The data frame should have at least the following three columns:

```
rowId (numeric) A unique identifier for each row (e.g. the person ID)
treatment (integer) Column indicating whether the person is in the treated (1) or comparator (0) group
propensityScore (numeric) Propensity score
```

This function implements the greedy variable-ratio matching algorithm described in Rassen et al (2012).

#### Value

Returns a date frame with the same columns as the input data plus one extra column: stratumId. Any rows that could not be matched are removed

#### References

Rassen JA, Shelat AA, Myers J, Glynn RJ, Rothman KJ, Schneeweiss S. (2012) One-to-many propensity score matching in cohort studies, Pharmacoepidemiology and Drug Safety, May, 21 Suppl 2:69-80.

### **Examples**

matchOnPsAndCovariates

Match by propensity score as well as other covariates

### Description

matchOnPsAndCovariates uses the provided propensity scores and a set of covariates to match treated to comparator persons.

### Usage

```
matchOnPsAndCovariates(population, caliper = 0.25,
  caliperScale = "standardized", maxRatio = 1, cohortMethodData,
  covariateIds)
```

matchOnPsAndCovariates 29

#### **Arguments**

population A data frame with the three columns described below.

caliper The caliper for matching. A caliper is the distance which is acceptable for any

match. Observations which are outside of the caliper are dropped. A caliper of

0 means no caliper is used.

caliperScale The scale on which the caliper is defined. Two scales are supported:

caliperScale = 'propensity score' or caliperScale = 'standardized'. On the standardized scale, the caliper is interpreted in standard deviations of the

propensity score distribution.

maxRatio The maximum number of persons int the comparator arm to be matched to each

person in the treatment arm. A maxRatio of 0 means no maximum: all com-

parators will be assigned to a treated person.

cohortMethodData

An object of type cohortMethodData as generated using getDbCohortMethodData.

covariateIds One or more covariate IDs in the cohortMethodData object on which subjects

should be also matched.

#### Details

The data frame should have at least the following three columns:

rowId (numeric) A unique identifier for each row (e.g. the person ID)

treatment (integer) Column indicating whether the person is in the treated (1) or comparator

(0) group

propensityScore (numeric) Propensity score

This function implements the greedy variable-ratio matching algorithm described in Rassen et al (2012).

#### Value

Returns a date frame with the same columns as the input data plus one extra column: stratumId. Any rows that could not be matched are removed

### References

Rassen JA, Shelat AA, Myers J, Glynn RJ, Rothman KJ, Schneeweiss S. (2012) One-to-many propensity score matching in cohort studies, Pharmacoepidemiology and Drug Safety, May, 21 Suppl 2:69-80.

### **Examples**

# todo

plotCovariateBalanceOfTopVariables

Plot variables with largest imbalance

### Description

Create a plot showing those variables having the largest imbalance before matching, and those variables having the largest imbalance after matching. Requires running computeCovariateBalance first.

#### Usage

```
plotCovariateBalanceOfTopVariables(balance, n = 20, maxNameWidth = 100,
    fileName = NULL)
```

### **Arguments**

balance A data frame created by the computeCovariateBalance funcion.

n Count of variates to plot.

maxNameWidth Covariate names longer than this number of characters are truncated to create a

nicer plot.

fileName Name of the file where the plot should be saved, for example 'plot.png'. See the

function ggsave in the ggplot2 package for supported file formats.

### Value

A ggplot object. Use the ggsave function to save to file in a different format.

 $\verb|plotCovariateBalanceScatterPlot|$ 

Create a scatterplot of the covariate balance

### **Description**

Create a scatterplot of the covariate balance, showing all variables with balance before and after matching on the x and y axis respectively. Requires running computeCovariateBalance first.

#### Usage

```
plotCovariateBalanceScatterPlot(balance, fileName = NULL)
```

### **Arguments**

balance A data frame created by the compute Covariate Balance function.

fileName Name of the file where the plot should be saved, for example 'plot.png'. See the

function ggsave in the ggplot2 package for supported file formats.

#### Value

A ggplot object. Use the ggsave function to save to file in a different format.

plotKaplanMeier 31

plotKaplanMeier	Plot the Kaplan-Meier curve	

### Description

plotKaplanMeier creates the Kaplain-Meier survival plot

### Usage

```
plotKaplanMeier(population, censorMarks = FALSE, confidenceIntervals = TRUE,
  includeZero = TRUE, dataCutoff = 0.99, treatmentLabel = "Treated",
  comparatorLabel = "Comparator", title = "Kaplan-Meier Plot",
  fileName = NULL)
```

### Arguments

population A population object generated by createStudyPopulation, potentially filtered

by other functions.

censorMarks Whether or not to include censor marks in the plot.

confidenceIntervals

Plot 95 percent confidence intervals?

includeZero Should the y axis include zero, or only go down to the lowest observed survival?

dataCutoff Fraction of the data (number censored) after which the graph will not be shown.

treatmentLabel A label to us for the treated cohort.

comparatorLabel

A label to us for the comparator cohort.

title The main title of the plot.

fileName Name of the file where the plot should be saved, for example 'plot.png'. See the

function ggsave in the ggplot2 package for supported file formats.

#### Value

A ggplot object. Use the ggsave function to save to file in a different format.

### **Examples**

# todo

32 plotPs

plotPs

Plot the propensity score distribution

### **Description**

plotPs shows the propensity (or preference) score distribution

#### Usage

```
plotPs(data, unfilteredData = NULL, scale = "preference",
  type = "density", binWidth = 0.05, treatmentLabel = "Treated",
  comparatorLabel = "Comparator", fileName = NULL)
```

### **Arguments**

data A data frame with at least the two columns described below

unfilteredData To be used when computing preference scores on data from which subjects have

already been removed, e.g. through trimming and/or matching. This data frame

should have the same structure as data.

scale The scale of the graph. Two scales are supported: scale = 'propensity' or

scale = 'preference'. The preference score scale is defined by Walker et al

(2013).

type Type of plot. Two possible values: type = 'density' or type = 'histogram'

binWidth For histograms, the width of the bins treatmentLabel A label to us for the treated cohort.

comparatorLabel

A label to us for the comparator cohort.

fileName Name of the file where the plot should be saved, for example 'plot.png'. See the

function ggsave in the ggplot2 package for supported file formats.

### **Details**

The data frame should have a least the following two columns:

treatment (integer) Column indicating whether the person is in the treated (1) or comparator

(0) group

propensityScore (numeric) Propensity score

#### Value

A ggplot object. Use the ggsave function to save to file in a different format.

#### References

Walker AM, Patrick AR, Lauer MS, Hornbrook MC, Marin MG, Platt R, Roger VL, Stang P, and Schneeweiss S. (2013) A tool for assessing the feasibility of comparative effectiveness research, Comparative Effective Research, 3, 11-20

runCmAnalyses 33

#### **Examples**

```
treatment <- rep(0:1, each = 100)
propensityScore <- c(rnorm(100, mean = 0.4, sd = 0.25), rnorm(100, mean = 0.6, sd = 0.25))
data <- data.frame(treatment = treatment, propensityScore = propensityScore)
data <- data[data$propensityScore > 0 & data$propensityScore < 1, ]
plotPs(data)</pre>
```

runCmAnalyses

Run a list of analyses

### **Description**

Run a list of analyses

### Usage

```
runCmAnalyses(connectionDetails, cdmDatabaseSchema,
  oracleTempSchema = cdmDatabaseSchema,
  exposureDatabaseSchema = cdmDatabaseSchema, exposureTable = "drug_era",
  outcomeDatabaseSchema = cdmDatabaseSchema,
  outcomeTable = "condition_occurrence", cdmVersion = 4,
  outputFolder = "./CohortMethodOutput", cmAnalysisList,
  drugComparatorOutcomesList, refitPsForEveryOutcome = FALSE,
  getDbCohortMethodDataThreads = 1, createPsThreads = 1, psCvThreads = 1,
  createStudyPopThreads = 1, trimMatchStratifyThreads = 1,
  computeCovarBalThreads = 1, fitOutcomeModelThreads = 1,
  outcomeCvThreads = 1)
```

#### **Arguments**

connectionDetails

An R object of type connectionDetails created using the function createConnectionDetails in the DatabaseConnector package.

cdmDatabaseSchema

The name of the database schema that contains the OMOP CDM instance. Requires read permissions to this database. On SQL Server, this should specify both the database and the schema, so for example 'cdm\_instance.dbo'.

oracleTempSchema

For Oracle only: the name of the database schema where you want all temporary tables to be managed. Requires create/insert permissions to this database.

 ${\tt exposureDatabaseSchema}$ 

The name of the database schema that is the location where the exposure data used to define the exposure cohorts is available. If exposureTable = DRUG\_ERA, exposureDatabaseSchema is not used by assumed to be cdmSchema. Requires read permissions to this database.

exposureTable

The tablename that contains the exposure cohorts. If exposureTable <> DRUG\_ERA, then expectation is exposureTable has format of COHORT table: COHORT\_DEFINITION\_ID, SUBJECT\_ID, COHORT\_START\_DATE, COHORT\_END\_DATE.

34 runCmAnalyses

outcomeDatabaseSchema

The name of the database schema that is the location where the data used to define the outcome cohorts is available. If exposureTable = CONDITION\_ERA, exposureDatabaseSchema is not used by assumed to be cdmSchema. Requires

read permissions to this database.

outcomeTable The tablename that contains the outcome cohorts. If outcomeTable <> CONDI-

TION\_OCCURRENCE, then expectation is outcomeTable has format of CO-HORT table: COHORT\_DEFINITION\_ID, SUBJECT\_ID, COHORT\_START\_DATE,

COHORT\_END\_DATE.

cdmVersion Define the OMOP CDM version used: currently support "4" and "5".

outputFolder Name of the folder where all the outputs will written to.

cmAnalysisList A list of objects of type cmAnalysis as created using the createCmAnalysis

function.

drugComparatorOutcomesList

A list of objects of type drugComparatorOutcomes as created using the createDrugComparatorOutcomes function.

refitPsForEveryOutcome

Should the propensity model be fitted for every outcome (i.e. after people who already had the outcome are removed)? If false, a single propensity model will be fitted, and people who had the outcome previously will be removed afterwards.

 ${\tt getDbCohortMethodDataThreads}$ 

The number of parallel threads to use for building the cohortMethod data objects.

createPsThreads

The number of parallel threads to use for fitting the propensity models.

psCvThreads

The number of parallel threads to use for the cross-validation when estimating the hyperparameter for the propensity model. Note that the total number of CV threads at one time could be 'createPsThreads'.

 ${\tt createStudyPopThreads}$ 

The number of parallel threads to use for creating the study population.

 $trim {\tt MatchStratifyThreads}$ 

 $\label{threads} The number of parallel threads to use for trimming, matching and stratifying. compute {\tt CovarBalThreads}$ 

The number of parallel threads to use for computing the covariate balance.

fitOutcomeModelThreads

The number of parallel threads to use for fitting the outcome models.

outcomeCvThreads

The number of parallel threads to use for the cross-validation when estimating the hyperparameter for the outcome model. Note that the total number of CV threads at one time could be 'fitOutcomeModelThreads \* outcomeCvThreads'.

#### **Details**

Run a list of analyses for the drug-comparator-outcomes of interest. This function will run all specified analyses against all hypotheses of interest, meaning that the total number of outcome models is 'length(cmAnalysisList) \* length(drugComparatorOutcomesList)' (if all analyses specify an outcome model should be fitted). When you provide several analyses it will determine whether any of the analyses have anything in common, and will take advantage of this fact. For example, if we specify several analyses that only differ in the way the outcome model is fitted, then this function will extract the data and fit the propensity model only once, and re-use this in all the analysis.

saveCmAnalysisList 35

#### Value

A data frame with the following columns:

analysisId The unique identifier for a set of analysis choices.

targetId The ID of the target drug.
comparatorId The ID of the comparator group.

 $\begin{array}{ll} \text{excludedCovariateConceptIds} & \text{The ID(s) of concepts that cannot be used to construct covariates.} \\ \text{includedCovariateConceptIds} & \text{The ID(s) of concepts that should be used to construct covariates.} \\ \end{array}$ 

outcomeId The ID of the outcome cohortMethodDataFolder The ID of the outcome.

sharedPsFile The name of the file containing the propensity scores of the shared

propensity model. This model is used to create the outcome-specific

propensity scores by removing people with prior outcomes.

studyPopFile The name of the file containing the study population (prior

and trimming, matching, or stratification on the PS.

psFile The name of file containing the propensity scores for a specific

outcomes (ie after people with prior outcomes have been removed).

strataFile The name of the file containing the identifiers of the population

after any trimming, matching or stratifying, including their strata.

output of the computeCovariateBalance function.

outcomeModelFile The name of the file containing the outcome model.

saveCmAnalysisList Save a list of cmAnalysis to file

### **Description**

Write a list of objects of type cmAnalysis to file. The file is in JSON format.

### Usage

saveCmAnalysisList(cmAnalysisList, file)

### **Arguments**

cmAnalysisList The cmAnalysis list to be written to file

The name of the file where the results will be written

 ${\tt save Cohort\,MethodData} \quad \textit{Save the cohort data to folder}$ 

### **Description**

saveCohortMethodData saves an object of type cohortMethodData to folder.

#### **Usage**

saveCohortMethodData(cohortMethodData, file)

### **Arguments**

cohortMethodData

An object of type cohortMethodData as generated using getDbCohortMethodData.

file

The name of the folder where the data will be written. The folder should not yet

### **Details**

The data will be written to a set of files in the folder specified by the user.

### **Examples**

# todo

 ${\tt saveDrugComparatorOutcomesList}$ 

Save a list of drugComparatorOutcome to file

### **Description**

Write a list of objects of type drugComparatorOutcomes to file. The file is in JSON format.

### Usage

save Drug Comparator Outcomes List (drug Comparator Outcomes List, file)

### **Arguments**

 ${\tt drugComparatorOutcomesList}$ 

The drugComparatorOutcomes list to be written to file

file The name of the file where the results will be written

simulateCohortMethodData

Generate simulated data

### **Description**

 $\verb|simulateCohortMethodData| creates a cohortMethodData| object with simulated data.$ 

### Usage

```
simulateCohortMethodData(profile, n = 10000)
```

stratifyByPs 37

### **Arguments**

profile An object of type cohortMethodDataSimulationProfile as generated using

the

 ${\tt createCohortMethodDataSimulationProfile\ function}.$ 

n The size of the population to be generated.

### **Details**

This function generates simulated data that is in many ways similar to the original data on which the simulation profile is based. The contains same outcome, comparator, and outcome concept IDs, and the covariates and their 1st order statistics should be comparable.

#### Value

An object of type cohortMethodData.

stratifyByPs

Stratify persons by propensity score

### **Description**

stratifyByPs uses the provided propensity scores to stratify persons. Additional stratification variables for stratifications can also be used.

### Usage

```
stratifyByPs(population, numberOfStrata = 5, stratificationColumns = c())
```

### **Arguments**

population A data frame with the three columns described below

numberOfStrata How many strata? The boundaries of the strata are automatically defined to

contain equal numbers of treated persons.

stratificationColumns

Names of one or more columns in the data data.frame on which subjects should

also be stratified in addition to stratification on propensity score.

### **Details**

The data frame should have the following three columns:

rowId (numeric) A unique identifier for each row (e.g. the person ID)

treatment (integer) Column indicating whether the person is in the treated (1) or comparator

(0) group

propensityScore (numeric) Propensity score

### Value

Returns a date frame with the same columns as the input data plus one extra column: stratumId.

#### **Examples**

```
rowId <- 1:200
treatment <- rep(0:1, each = 100)
propensityScore <- c(runif(100, min = 0, max = 1), runif(100, min = 0, max = 1))
data <- data.frame(rowId = rowId, treatment = treatment, propensityScore = propensityScore)
result <- stratifyByPs(data, 5)</pre>
```

stratifyByPsAndCovariates

Stratify persons by propensity score and other covariates

### **Description**

stratifyByPsAndCovariates uses the provided propensity scores and covariates to stratify persons.

### Usage

```
stratifyByPsAndCovariates(population, numberOfStrata = 5, cohortMethodData,
    covariateIds)
```

### **Arguments**

population A data frame with the three columns described below

numberOfStrata Into how many strata should the propensity score be divided? The boundaries of

the strata are automatically defined to contain equal numbers of treated persons.

cohortMethodData

An object of type cohortMethodData as generated using getDbCohortMethodData.

covariateIds One or more covariate IDs in the cohortMethodData object on which subjects

should also be stratified.

### **Details**

The data frame should have the following three columns:

rowId (integer) A unique identifier for each row (e.g. the person ID)

treatment (integer) Column indicating whether the person is in the treated (1) or comparator

(0) group

propensityScore (numeric) Propensity score

### Value

Returns a date frame with the same columns as the input population plus one extra column: stratumId.

### **Examples**

# todo

trimByPs 39

summarizeAnalyses	Create a summary report of the analyses

### **Description**

Create a summary report of the analyses

### Usage

summarizeAnalyses(outcomeReference)

#### **Arguments**

outcomeReference

A data.frame as created by the runCmAnalyses function.

#### Value

A data frame with the following columns:

analysisId The unique identifier for a set of analysis choices.

targetId The ID of the target drug.
comparatorId The ID of the comparator group.

indicationConceptIds The ID(s) of indications in which to nest to study.

outcomeId The ID of the outcome.
rr The estimated effect size.

ci95lb The lower bound of the 95 percent confidence interval. ci95ub The upper bound of the 95 percent confidence interval.

treated The number of subjects in the treated group (after any trimming and matching).

Comparator eventsTreated The number of subjects in the comparator group (after any trimming and matching).

The number of outcomes in the treated group (after any trimming and matching).

The number of outcomes in the comparator group (after any trimming and matching).

matching).

logRr The log of the estimated relative risk.

seLogRr The standard error of the log of the estimated relative risk.

trimByPs	Trim persons by propensity score	

### **Description**

 $\verb|trimByPs| uses the provided propensity scores to trim subjects with extreme scores.$ 

### Usage

```
trimByPs(population, trimFraction = 0.05)
```

### **Arguments**

population A data frame with the three columns described below

trimFraction This fraction will be removed from each treatment group. In the treatment group,

persons with the highest propensity scores will be removed, in the comparator

group person with the lowest scores will be removed.

### **Details**

The data frame should have the following three columns:

rowId (numeric) A unique identifier for each row (e.g. the person ID)

treatment (integer) Column indicating whether the person is in the treated (1) or comparator

(0) group

propensityScore (numeric) Propensity score

#### Value

Returns a date frame with the same three columns as the input.

### **Examples**

```
rowId <- 1:2000
treatment <- rep(0:1, each = 1000)
propensityScore <- c(runif(1000, min = 0, max = 1), runif(1000, min = 0, max = 1))
data <- data.frame(rowId = rowId, treatment = treatment, propensityScore = propensityScore)
result <- trimByPs(data, 0.05)</pre>
```

trimByPsToEquipoise

Keep only persons in clinical equipoise

#### Description

trimByPsToEquipoise uses the preference score to trim subjects that are not in clinical equipoise

### Usage

```
trimByPsToEquipoise(population, bounds = c(0.25, 0.75))
```

### **Arguments**

population A data frame with at least the three columns described below

bounds The upper and lower bound on the preference score for keeping persons

### Details

The data frame should have the following three columns:

rowId (numeric) A unique identifier for each row (e.g. the person ID)

treatment (integer) Column indicating whether the person is in the treated (1) or comparator

(0) group

propensityScore (numeric) Propensity score

### Value

Returns a date frame with the same three columns as the input.

Walker AM, Patrick AR, Lauer MS, Hornbrook MC, Marin MG, Platt R, Roger VL, Stang P, and Schneeweiss S. (2013) A tool for assessing the feasibility of comparative effectiveness research, Comparative Effective Research, 3, 11-20

### **Examples**

```
rowId <- 1:2000
treatment <- rep(0:1, each = 1000)
propensityScore <- c(runif(1000, min = 0, max = 1), runif(1000, min = 0, max = 1))
data <- data.frame(rowId = rowId, treatment = treatment, propensityScore = propensityScore)
result <- trimByPsToEquipoise(data)</pre>
```
